

# VPview v3.7.2

## Release Notes

December 2019

### New features

1. “SAM Data” check box added to the form for data conversion with TEM2Mom. Previously there was no easy way to distinguish SAM (“total field”) data from conventional B-field data, since their TEM formats are identical. Now the expedited construction of starting model for unconstrained inversion is available for SAM data sets.
2. AEM2Mom can now correctly handle SkyTEM and VTEM data sets with the Rx displaced horizontally from the centre of the Tx loop.
3. The VPview window is now fully resizable.
4. Improvements to section display controls.
5. Refreshed *Model Definitions* and *View Model* layouts.
6. User modifications to model parameters are saved (in memory) when toggling between input and output models.
